

## One Water LA Discussion Exercise

1. Given the competing needs and uses for wastewater (recycled water, graywater, satellite treatment, etc.) as a resource along with its finite nature, do you have any suggestions or recommendations on how we should approach this dilemma?

2. Given the goal of reducing dependence on imported water, improving water quality and flood management, capturing and using stormwater as an increased local water resource is both desirable and challenging.

From what you know already about stormwater, what do you think are the best ideas out there to maximize its potential?

What do you perceive to be the challenges to implementing significantly greater stormwater capture?
