

Worm Composting

Worm composting is an easy and fun way to compost kitchen scraps such as fruit and vegetable peels, eggshells, tea leaves and coffee grounds. Fill a small box with two inches of bedding material like moist straw or shredded newspaper. Introduce the worms to the bedding and add some food scraps to the top. Close the box, and let the worms do the rest. Worm composting is great for people with limited yard space.

Grasscycling

Grasscycling is a simple natural process of recycling cut grass clippings merely by leaving them on the lawn. Grasscycling saves time, work, and money. Clippings left on the lawn quickly decompose into humus which increases the soil's water holding capacity and releases nutrients back into the soil. Proper fertilizing and grasscycling will enhance the appearance of your lawn.
